

## Bulk Property Uploads

- The destination table has an index field (id) that is used in the minpropertyinfo, regions and locations tables. Destination contains areas of the world that individual properties would reside in. You wouldn't insert information directly into the destination table. If you don't see a destination that represents their location, we would have to add the destination and program it into the website.
- The Region table has an index field(id) that is used in the locations and minpropertyinfo tables. This table corresponds to the country that the property resides in. Once again if your region (country) isn't in the list then you will need to provide an insert with the appropriate destination id (did) in the insert.
- The location table is the city or city and county or city and state. This is pretty much a free field but it is advised to correctly spell what is entered and also use this sequence "city county state zip street address". Use one or all of the preceding. Also this table insert requires the appropriate destination and region keys.
- The propertyid field and listingid field that will have to be completed by us. Please provide XXXXXXXX where the propertyid would go and QQQQQQQQ where the listingid would go. Tables that would be affected are advancedpropertydetails, activities, amenities, attractions, communication minpropertyinfo, propertypictures, and propertyrates.
- The table PropertyPictures table 'piclocation' field should contain the name of the image in this format "GGGGGGGG/imagename.gif" where the image file name is imagename.gif. We will use the GGGGGGGG portion to insert information required by the website.
